Defensive Driving Training for Oil & Gas

Service Objectives

Industry-specific training that turns road rules and operator controls into field-ready behaviours for oilfield and downstream transport risks in the UAE.

- Operationalise defensive principles on high-speed corridors (E11/E311), fog-prone routes, and graded access roads.
- Apply vehicle dynamics, load securement, and tanker physics to prevent rollovers, jackknifes, and loss of control.
- Embed journey management: fatigue thresholds, weather advisories, RTA/DoT updates, and gate times to reduce risk stacking.
- Master convoy spacing and communication, safe overtaking, reversing with a banksman, safe parking, and yard manoeuvring.
- Respond correctly to H2S alarms, fires, spills, fog closures, and roadside emergencies without creating secondary risks.
- Link behaviours to IVMS/telematics (overspeed, harsh events, seatbelts) to cut MVIs and meet client KPIs.

> Aligned with ADNOC Land Transport and Road Safety (LTR), OSHAD SF, and emirate transport authority expectations; integrates client IVMS thresholds for measurable improvement.

Who This Service Is For (Oil & Gas)

Designed for oil and gas operators and contractors with vehicle-intensive logistics across upstream, midstream, and downstream assets.

- Company and contractor drivers of light vehicles, pick-ups, buses, vacuum trucks, and fuel/chemical tankers operating between well pads, compressor stations, refineries, and ports.
- Journey managers, transport planners, and gate/security supervisors applying route risk assessments, journey plans, and IVMS rules.
- Upstream roles: rig move convoy leads, hot-shot drivers, field maintenance teams travelling long distances, at night, or on graded tracks.
- Midstream/downstream: tanker drivers, terminal switchers, and product delivery drivers managing tight manoeuvres, reversing, and ignition source control.
- Plant personnel driving on-lease in shared spaces with pedestrians, forklifts, and mobile lifting equipment.
- HSE managers and contractor coordinators seeking auditable competency evidence mapped to operator controls and incident learnings.

Duration & Process Overview

- Blended Core — 1 day (8 hours): classroom, yard manoeuvres, short in-vehicle route.
- Enhanced Field — 2 days (12–14 hours): extended in-vehicle routes with IVMS-informed coaching.
- Refresher/Targeted — 4–6 hours: scenario workshop and focused drive assessment.
- Cohorts: 8–12 per classroom; 4–6 per vehicle rotation. Delivery on client premises, designated training areas, or hybrid with virtual pre-briefings. English/Arabic/Hindi-Urdu.

Methodology

A modular programme mapped to high-frequency, high-severity driving exposures across UAE upstream, midstream, and downstream operations.

Phase	Objective	Deliverable
Needs Analysis & Tailoring	Gather route maps, terminal rules, journey management procedures, and IVMS policy.	Tailored scenarios, checklists, and assessment criteria.
Module 1 — Oil & Gas Risk Profile + UAE Road Rules	Contextualise fatigue, fog corridors, and mixed-traffic choke points; turn rules into prevention.	Risk picture and practical rule application.
Module 2 — Vehicle Dynamics & Tanker Hazards	Manage weight transfer, stopping distances, surge/baffles, and rollover thresholds.	Adapted speed/spacing and handling decisions for load conditions.
Module 3 — Journey Management & Convoys	Route risk scoring, rest windows, convoy spacing/communications, and escalation/stand-down.	Route plans and convoy protocols that hold under pressure.
Module 4 — Low-Speed Mastery & Yard Safety	Systematic reversing with a banksman, signal clarity, tight-turn control, safe parking/chocking, ignition source control.	Yard manoeuvre and reversing checklist.
Module 5 — Emergency Response While Driving	Actions for H2S alarms, blowouts, vehicle fires, minor spills; scene security and communications.	Decision trees aligned to site emergency plans and external services.
Module 6 — In-Vehicle Coaching & IVMS	Coach real-world routes; link behaviours to IVMS (overspeed, harsh events, seatbelts).	Individual feedback and corrective action plan tied to client KPIs.
Assessment & Certification	Written/visual checks and on-road evaluation against observable behaviours.	NPM certificate with hours, results, and refresh recommendations; employer sign-off as applicable.
Post-Course Improvement	Supervisor reinforcement using telematics and targeted refreshers; audit evidence maintained.	Assessment records and improvement plans for sustained change.
