SIL Training Dubai

Service Objectives

- Build practical competence to plan, implement, and sustain Safety Instrumented Systems (SIS) across the IEC 61508/61511 lifecycle.
- Interpret hazard scenarios and apply HAZOP/LOPA to allocate risk reduction between SIFs and other IPLs, with credible demand rates.
- Translate SIL targets into design inputs: sensor/logic solver/actuator selection, architectures, diagnostics, and proof-test strategies.
- Develop maintainable proof-test procedures and bypass/override controls suited to Dubai shift patterns and contractor realities.
- Compile a defensible documentation pack (SRS, verification records, PFDavg, cause-and-effect, maintenance logs) ready for audit.
- Reduce spurious trips and unjustified overdesign; improve uptime, compliance confidence, and audit readiness.

> Aligned to IEC 61508/61511 and Dubai authority expectations. Dubai-centric case work ensures calculations convert into clear operational actions.

Who This Service Is For

- Functional safety stakeholders across Dubai’s industrial hubs: instrument/control and process engineers, operations supervisors, reliability/integrity teams, maintenance planners, HSE managers.
- Facilities: oil and gas terminals, petrochemical storage/blending, power generation (CCGT), utilities, high-hazard manufacturing, and logistics with hazardous inventories.
- Organisations interfacing with Dubai Municipality requirements and Dubai Civil Defence approvals seeking actionable compliance.
- Tenants and operators in JAFZA, Jebel Ali Port and Industrial Area, Dubai Investment Park (DIP), Dubai Industrial City, and free zones.
- EPCs, system integrators, and OEMs executing Dubai megaprojects needing robust bid/design deliverables and FAT/SAT evidence.
- Lifecycle moments: HAZOP/LOPA campaigns, SIS upgrades, MOC for SIF changes, shutdown/override planning, proof-test interval optimisation, incident follow-up.

Duration & Process Overview

- Delivery: 3-day intensive (≈24 contact hours) or modular over 1–2 weeks; in-house at Jebel Ali/DIP/corporate offices, hosted venue, or hybrid with live facilitation.
- Class size: optimised at 10–16 delegates; parallel cohorts by discipline can be arranged with a combined integration workshop.

- Flow: scoping and tailoring; foundations; hands-on LOPA/SIL verification; operations-focused sessions; final integration of SRS, C&E, PFDavg, and proof-test planning.
- Assessment & certification: quizzes, calculation worksheets, capstone exercise; NPM Certificate of Completion (training evidence; internal authorisations remain with the client).

Methodology

Structured modules blend lectures, collaborative workshops, and Dubai-relevant case exercises. Each phase reinforces lifecycle decisions from hazard identification to operations and change.

Phase	What It Covers / Applied Exercise	Typical Duration
1. Functional Safety Foundations	IEC 61508/61511, SIS lifecycle, roles; map lifecycle tasks to a Dubai brownfield upgrade.	3 hours
2. Hazard Analysis to LOPA	HAZOP inputs, IPL criteria, initiating event rates, risk matrices; derive SIL targets from a JAFZA tank farm scenario.	4 hours
3. SIL Determination & Verification	PFDavg, architectures, diagnostic coverage, proof-test intervals; verify SIL for ESD valves and gas detection SIFs.	4 hours
4. Specification & Design	SRS content, logic solver choices, C&E development, cybersecurity touchpoints; draft SRS extract and C&E for a compressor trip.	3 hours
5. Operations, Proof Testing & Overrides	Proof-test planning, bypass management, impairment risk controls; build a plan workable for DIP shift/contractor patterns.	3 hours
6. Change, Incident Learning & Audit	MOC for SIF changes, periodic review, KPIs, audit readiness; prepare an audit evidence bundle for Dubai authority review.	3 hours
